## PRELIMINARY DIAGNOSES OF MORE NEW SPECIES OF REPTILES FROM ISLANDS IN THE GULF OF CALIFORNIA, MEXICO

JOHN VAN DENBURGH and JOSEPH R. SLEVIN

1921

### ***Crotalus tortugensis***, new species

*Diagnosis*.—Similar to *Crotalus atrox*, but with dorsal rhombs differently marked. Margins of rhombs much darker than central portions which usually include on each side a group of lighter scales as pale as the general dorsal ground color. These light areas in the rhombs may spread and be connected across the back. The coloration suggests that of *C. molossus*, although the light borders of the rhombs are very incomplete.

*Type*.—California Academy of Sciences No. 50515; collected by Joseph R. Slevin, on Tortuga Island, Gulf of California, Mexico, June 22, 1921.
